Synthesis: China's Rise Through Structural and Historical Lenses

These sources converge on a **structural-historical** reading of China's ascent — not as an isolated national achievement but as a systemic transition embedded in long-cycle dynamics of capital accumulation and geopolitical ordering.

Core Framework: Hegemonic Transition as Systemic Process

Arrighi provides the analytical spine: hegemonic transitions follow recurrent patterns where financial expansion signals the maturity (and coming obsolescence) of a dominant power's productive advantage. China's rise isn't anomalous — it fits the logic of previous shifts (Dutch → British → American). The US financialization wave since the 1970s maps onto prior hegemonic endgames.

Martins reinforces this structural reading from the periphery's vantage: dependency relations aren't policy failures but **design features** of capitalist world-systems. If Arrighi describes the rhythm of hegemonic cycling, Martins describes the hierarchical architecture that persists *through* those cycles. China's trajectory involves navigating — and potentially reconfiguring — that dependency structure, not simply graduating from it.

Geopolitical Theory as Political Instrument

Krause introduces a crucial methodological caution: geopolitical theories (Mackinder's Heartland) function less as neutral analytical tools than as **legitimation devices** for policy. This matters for China analysis — are we using systemic frameworks to understand transition dynamics, or are we unwittingly adopting US policy categories that frame China as threat rather than as systemic successor?

The Soviet Shadow

Kotkin surfaces the question that haunts Chinese strategic planning: **how to avoid Soviet collapse**. This creates tension with Arrighi's cyclical optimism. Where Arrighi's framework suggests China could be the next hegemon in a recurring pattern, Kotkin (via the CCP's own anxieties) points to *discontinuity* — the possibility that Leninist party-states face specific pathologies that disrupt

smooth hegemonic succession.

Tension to Resolve

Does China's Leninist structure enable or obstruct hegemonic transition? Arrighi's cycles assume flexible adaptation to new accumulation regimes. Soviet collapse suggests ideological rigidity can derail that process. The CCP's obsessive study of Soviet failure indicates awareness of this vulnerability, but it's unclear whether their diagnosis is correct or their remedies sufficient.

Most Promising Thread

The relationship between party-state structure and financial hegemony. Arrighi's cycles hinge on financial deepening and the provision of systemic liquidity. Can a Leninist party-state with capital controls and limited currency convertibility actually complete a hegemonic transition? Or does the model require a different endpoint — regional rather than global hegemony, or a novel form of "state-capitalist" world-system leadership? This is where structural cycle theory meets institutional specificity.
