

Spec — Commit Learning System Foundation Documents

Created: 2026-06-16 — Claude.ai Status: Ready for `_working/`

Context

mini-moi is beginning a structured approach to institutional knowledge — capturing design reasoning, not just build decisions, and establishing the foundation for a local LLM that learns the project over time. This spec commits the foundational documents and makes the minimal workflow changes needed to start Phase 0.

Full vision: `docs/LEARNING_SYSTEM_ROADMAP.md` (committed in this spec).

Changes

1. New files to commit

`docs/LEARNING_SYSTEM_ROADMAP.md` Content: as produced in this session (attached). The GitHub-visible roadmap for the learning system. Explains the institutional memory model, the local LLM role, and the phased plan.

`docs/DESIGN_SESSION_PROMPT.md` Content: as produced in this session (attached). The prompt pasted at the start of any design conversation — Claude, Grok, OpenAI, or local LLM. Produces Decision Records on command.

`docs/decision-records/` Create this directory with a `.gitkeep` so it exists in the repo. First real DRs will be added as they're produced going forward. Add a one-line `README.md` inside:

Decision Records capture the reasoning behind significant design decisions — alternatives considered, constraints, assumptions, and principles. See `docs/DESIGN_SESSION_PROMPT.md` for format and usage.

2. Amend `docs/HANDOFF_PROCESS.md`

Add a section after the existing spec conventions:

markdown

Decision Records

For any significant architectural or product decision, produce a Decision Record alongside the spec. Use the design session prompt in ``docs/DESIGN_SESSION_PROMPT.md`` to structure the conversation and trigger the DR output.

A DR is worth producing when:

- Multiple alternatives were genuinely considered
- The negative reasoning (what we didn't do and why) would be non-obvious from the spec alone
- A constraint shaped the decision that might change later
- A generalizable principle emerged

DR naming: ``dr_[topic]_[YYYY-MM-DD].md``

DR location: ``docs/decision-records/``

Spec reference: add one line to spec – `*Reasoning: see `dr_[name].md`*`

When in doubt, produce a short one. 200 words is better than nothing.

3. Amend `README.md`

Add `(docs/LEARNING_SYSTEM_ROADMAP.md)` to the docs section of the README so it's visible as a top-level project document on GitHub. One line: `– [Learning System Roadmap] (docs/LEARNING_SYSTEM_ROADMAP.md) – how mini-moi builds institutional knowledge over time`

Definition of Done

- `(docs/LEARNING_SYSTEM_ROADMAP.md)` exists in repo and renders correctly on GitHub
- `(docs/DESIGN_SESSION_PROMPT.md)` exists in repo
- `(docs/decision-records/)` directory exists with README.md inside
- `(docs/HANDOFF_PROCESS.md)` includes the Decision Records section
- `(README.md)` links to the learning system roadmap
- No other files changed in this commit

Commit

`(Add learning system foundation: roadmap, design session prompt, decision-records directory, HANDOFF_PROCESS amendment.)`
