

Spec — Mein Deutsch v1.1: GitHub Release + Landing Copy Update

mini-moi · Guild Created: 2026-06-15 — Claude.ai Status: spec_ready For: Claude Code Pairs with: design_gesprache_crossworkflow_2026-06-15.md

What this is

Two things in one commit:

1. **GitHub release** — marks Mein Deutsch v1.1, calling out the cross-workflow learning loop between KI-Personas and real people as a named, visible feature
2. **minimoi.ai landing copy update** — updates the Mein Deutsch entry in "What's running" to lead with the learning loop insight

The cross-workflow features are shipping in phases (design doc covers them). This release note marks the milestone and makes the concept publicly visible on GitHub — the same way Guild v0.9 named what was already running.

Part 1 — GitHub Release

Release title

Mein Deutsch v1.1 — Cross-Workflow Learning Loop

Tag

mein-deutsch-v1.1

Release description

Mein Deutsch v1.1 — Cross-Workflow Learning Loop

The core insight behind Mein Deutsch: finding real German conversation partners depends heavily on where you live. In Germany or Austria, practice partners are everywhere. In Chicago, German speakers are scarce — the same challenge applies to Portuguese, French, and most languages that aren't Spanish. You can't just walk outside and find one.

KI-Personas fill that gap. But they don't replace real interaction — they prepare you for it and extend the learning from it.

The loop:

1. Practice with a KI-Persona — café waitress, museum guide, U-Bahn stranger — in a controlled setting where mistakes are low-stakes
2. Apply what you practiced in a real conversation (friend, tutor, chance encounter)
3. After the real conversation, review the transcript — what worked, what didn't
4. Create a new persona modeled on the real person or the patterns that emerged — to drill offline what happened in real life
5. Come back to the real person better prepared next time

What v1.1 adds:

- **In-browser KI-Sitzung** — Start Session / End Session inside the HTML interface, no copy-paste, no external tool required
- **Provider-agnostic review** — transcript analysis via Grok, OpenAI, or Claude (per-session selector)
- **Voice input in Gespräche** — MediaRecorder + Whisper transcription, session transcript auto-populates for review
- **Mit KI-Persona / Mit echtem Mensch tabs** — named to make the distinction and the loop explicit
- **Shared review backend** — same analysis engine for KI and real sessions, common error patterns tracked across both

Coming in v1.2:

- Persona creation from real conversations
- Cross-session pattern detection (errors that persist across both KI and real sessions surfaced as persistent patterns)

Vienna-tested. 69+ sessions and counting.

Part 2 — minimoi.ai Landing Copy Update

Current Mein Deutsch entry (to replace)

Mein Deutsch v1.0 — German language coaching pipeline. Create personas and scenes, hold a real-time conversation, then review the transcript and iterate. Vienna-tested. Lesen, Gespräche, Schreiben, Wörter. Anki cards built from your own mistakes.

New entry (Mein Deutsch v1.1)

Mein Deutsch v1.1 — German language coaching pipeline. Finding real German speakers to practice with depends on where you live — in Chicago, they're scarce. KI-Personas fill that gap: practice offline, apply with real people when you find them, then feed real conversations back into new personas to close the loop. Vienna-tested. Lesen, Gespräche, Schreiben, Wörter. Anki cards built from your own mistakes.

Word count: ~54 words (was ~32). Slightly longer than Curator (~31) and Guild (~48), but the learning loop explanation earns the space — it's the idea that makes Mein Deutsch distinct. Check layout on live site after update; if the column balance looks off, Claude Code to flag.

Version bump: "v1.0" → "v1.1" in the entry, matches the GitHub release.

Definition of Done

- ☐ GitHub release created with tag `mein-deutsch-v1.1` and description above
 - ☐ minimoi.ai "What's running" Mein Deutsch entry updated to new copy
 - ☐ Version shows as v1.1 in the entry
 - ☐ Layout check — "What's running" column still reads cleanly with the longer Mein Deutsch entry
 - ☐ Robert confirms on live site and on GitHub
-

Commit

bash

```
git add static/public/index.html # landing page copy
git commit -m "content: Mein Deutsch v1.1 – update landing copy with learning 1"
```

Updates 'What's running' Mein Deutsch entry to lead with the cross-workflow learning loop concept (real partners hard to access → KI-Personas fill gap → real conversations feed back into new personas). Bumps to v1.1 to match GitHub release. Word count increases from ~32 to ~54 – layout check done."

```
# Then create GitHub release via UI or gh CLI:
# gh release create mein-deutsch-v1.1 \
#   --title "Mein Deutsch v1.1 – Cross-Workflow Learning Loop" \
#   --notes "...
git push origin main
```
