

Build Plan — Schema + Career Portal + Challenger Phase 2

mini-moi · Guild · Curator Authored: 2026-06-10 19:23 CDT (2026-06-11 00:23 UTC) — Claude.ai

Build sequence: Item 1 → Item 2 → Item 3

Item 1 — Apply schema_phase4.sql

Why first: Loop A is writing to JSON fallback because the DB tables don't exist. Applying the schema unlocks DB writes for career opportunities, cos_agenda, and agent_feedback. Item 2 (portal page) reads from these tables, so schema must be live first.

Steps

Step 1 — Confirm Docker is up:

```
bash

docker compose up -d
pg_isready -h localhost -p 5432
```

Step 2 — Apply schema:

```
bash

psql "postgresql://minimoi:simple123@localhost:5432/personal_agents" \
-f domains/guild/db/schema_phase4.sql
```

Step 3 — Add robert_ro grants (if not in schema_phase4.sql already):

```
sql

GRANT SELECT ON jobs.career_opportunities TO robert_ro;
GRANT SELECT ON guild.cos_agenda TO robert_ro;
GRANT SELECT ON guild.agent_feedback TO robert_ro;
ALTER DEFAULT PRIVILEGES IN SCHEMA jobs GRANT SELECT ON TABLES TO robert_ro;
ALTER DEFAULT PRIVILEGES IN SCHEMA guild GRANT SELECT ON TABLES TO robert_ro;
```

Per `(docs/DB_SCHEMA.md)` pattern — robert_ro grant in the same migration, not a follow-up fix.

Step 4 — Update test_schema.py: Add checks for the three new tables:

```
python
```

```
# Add to existing test_schema.py checks
("jobs", "career_opportunities"),
("guild", "cos_agenda"),
("guild", "agent_feedback"),
```

Run: `venv/bin/python3 domains/guild/db/test_schema.py` — expect 28/28 (25 existing + 3 new).

Step 5 — Migrate JSON fallback data: Loop A has been writing to `data/guild/career_opportunities.json` since Phase 4 shipped. Migrate any existing records to the new DB table before the next Loop A run:

```
bash

python3 -c "
import json, psycopg2
# Read from JSON fallback, insert into jobs.career_opportunities
# Handle duplicates by url (UNIQUE constraint)
"
```

Check `data/guild/career_opportunities.json` exists and has records first. If empty or absent, skip migration.

Definition of done for Item 1:

- ☐ `test_schema.py` passes 28/28
- ☐ `robert_ro` can SELECT from all three new tables
- ☐ JSON fallback data migrated (or confirmed empty)
- ☐ Next Loop A run writes to DB, not JSON

Item 2 — Career Focus portal page

Why second: depends on schema from Item 1. Portal reads from `jobs.career_opportunities`.

Route

`GET /jobs` — main pipeline view (already registered as a portal tab from Phase 1 scaffold)

```
python
```

Warm lead flag: 🌟 copper star, small, inline with geo/type.

Status dropdown: simple `<select>` form on each card, POSTs to `/jobs/<id>/status`. No page reload needed — but a redirect back to the filtered view is fine for now.

Template structure:

```
templates/jobs/  
└─ jobs.html      ← main page
```

Template skeleton

```
html
```

```

{% extends "base.html" %}
{% block content %}

<!-- Status filter tabs -->
<div class="jobs-filter-tabs">
  {% for s in ['all','suggested','reviewing','applied','interview','offer','archived'] %}
    <a href="/jobs?status={{ s }}"
      class="{{ 'active' if current_status == s else '' }}">
      {{ s | title }}
      {% if s != 'all' %}
        <span class="count">{{ opportunities | selectattr('status','eq',s) | list | length }}
      {% endif %}
    </a>
  {% endfor %}
</div>

<!-- Opportunity cards -->
{% for opp in opportunities %}
{% if current_status == 'all' or opp.status == current_status %}
<div class="opp-card">
  <div class="opp-header">
    <span class="opp-title">{{ opp.title }} – {{ opp.company }}</span>
    <span class="opp-score" style="color: {{ score_color(opp.fit_score) }}">
      {{ opp.fit_score }} / 10
    </span>
  </div>
  <div class="opp-meta">
    {{ opp.geo }} · {{ opp.opportunity_type }}
    {% if opp.warm_lead %}<span class="warm-lead">★ Warm lead</span>{% endif %}
  </div>
  <div class="opp-narrative">{{ opp.fit_narrative }}</div>
  <div class="opp-actions">
    <span class="opp-date">Found: {{ opp.date_found | format_date }}</span>
    {% if opp.url %}
      <a href="{{ opp.url }}" target="_blank" class="opp-apply">Apply →</a>
    {% endif %}
    <form method="POST" action="/jobs/{{ opp.id }}/status" style="display:inline;">
      <select name="status" onchange="this.form.submit()">
        {% for s in ['suggested','reviewing','applied','interview','offer','archived'] %}
          <option value="{{ s }}" {{ 'selected' if opp.status == s }}>{{ s | title }}</option>
        {% endfor %}
      </select>
    </form>
  </div>
</div>
{% endfor %}

```

```

    </div>
</div>
{% endfor %}

<!-- Empty state -->
{% if opportunities | length == 0 %}
<p style="color:#888; padding:2rem;">No opportunities yet — Loop A runs twice daily.
{% endif %}

{% endblock %}

```

Add `score_color` template filter to Flask app:

```

python

@app.template_filter('score_color')
def score_color(score):
    if score >= 8.0: return '#C68A5E'
    if score >= 6.0: return '#B8860B'
    return '#888'

```

Definition of done for Item 2:

- ☐ `/jobs` renders from `jobs.career_opportunities` table
 - ☐ Status filter tabs work — `/jobs?status=suggested` filters correctly
 - ☐ Status dropdown updates DB and refreshes view
 - ☐ Score color coding correct
 - ☐ Warm lead flag shows for `warm_lead=true` rows
 - ☐ "Apply →" link opens in new tab
 - ☐ Empty state shows when no records
 - ☐ Robert signs off on the page visually before commit
-

Item 3 — Challenger Phase 2 (Curator integration)

Build after Items 1 and 2 are committed. Full spec already written:

`/working/handoff_challenger_phase2_curator_2026-06-10.md`

Summary of what Claude Code builds:

- Wire `ChallengerService` into `generate_dive.py` — synthesis becomes Round 1, service handles Rounds 2 and 3

- Portal dive template — collapsed "Challenger review" section when `show_process=True`
- Regression gate: dive output with `enabled: false` must be byte-identical to today's output
- Pre-release test: 5 real dives in transparent mode, Robert reviews, 4/5 must pass

Read the full handoff before starting: `_working/handoff_challenger_phase2_curator_2026-06-10.md`

Commit sequence

```
bash

# Item 1
git add domains/guild/db/schema_phase4.sql \
        domains/guild/db/test_schema.py
git commit -m "schema: apply phase4 tables - career_opportunities, cos_agenda, agent

# Item 2
git add templates/jobs/ [portal route file]
git commit -m "feat: career focus portal page - pipeline view, status management"

# Item 3 (separate session after Items 1+2 confirmed)
# See handoff_challenger_phase2_curator_2026-06-10.md for commit details
```

Build plan · Guild + Curator · 2026-06-10 19:23 CDT Sequence: schema → career portal → Challenger Phase 2
